                                                                                                    The polynucleotide sequences given in AAC99818 to AAC99977 encode the human secreted proteins given in AAB56077 to AAB56362. Human secreted proteins given in AAB56077 to AAB56362. Human secreted proteins given in AAB56077 to AAB56362. Human secreted correspond activities based on the tissues and cells the genes are expressed in. Examples of activities include: immunosuppressive; cardiant; can tiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; correspond corrective; antibacterial; corrected polynucleotides and proteins can be used to prevent, treat or ameliorate polynucleotides and proteins can be used to prevent, treat or ameliorate corrected condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which cardiovascular disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular carbinates e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular condisorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infection. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sumburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to requence telessues and in chemotaxis. The proteins can also be used as a condition of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ĥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                         Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition

    used for prevention and removal

                                       This is the amino acid sequence of the mutanase enzyme PT box, which decomposes the alpha-1,3 glucoside bond of mutan. The mutanase enzyme is used in the method of the invention for prevention and removal of plaque and bacteria on teeth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New fungal (hemi)cellulose degrading enzymes - for prodn. of lig. fuel gas and feed protein, have specified carbohydrate binding domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is one of B specified linking B regions which are derived from a cellulose- or hemicellulose-degrading enzyme and which are enriched in the amino acids Gly and/or Asn and/or Pro and/or Ser and/or Thr and/or Gln. It can be incorporated in a fusion protein comprising a catalytic domain from a cellulase, e.g. a Bacillus endoglucanase, and a carbohydrate binding domain from a fungal endoglucanase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                            Sequence of a peptide which is part of the heavy (H) chain (CH3) of an
                                                                                                                                                                                                                                                                                                                                                        A novel immunoglobulin (Ig) is claimed which comprises two heavy (H) polypeptide chains sufficient for the formation of a complete antique binding site or several such chains. The Ig is devoid of light (L) polypeptide chains. The Ig may be obtd. from prokaryotic cells, esp. E. coli, by: cloning a DNA or cDNA sequence coding for the WI domain of an Ig devoid of L chains obtainable from e.g. lymphocytes of Camelids; recovering the cloned fragment after amplification using a 5' primer contg. an Xho site and a 3' primer contg. the Spe site having the sequence in AAQ44383; cloning the recovered fragment is a vector; transforming host cells; and recovering the expression product of the VHH coding sequence. A nucleotide encoding the peptides in AAR49721-24 is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Immunoglobulin; Ig; heavy chain; constant region; variable region; antibody engineering; IgG2; IgG3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This 2-chain Ig molecule lacks any light chains. The Ig has e.g. improved solubility and aggregate much less than heavy chains of 4-chain. Igs. The Igs can be used normally for e.g. diagnosis, therapy, in vaccines, for isolation and purification of antigens and in the production of anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated immunoglobulin molecules devoid of light polypeptide chains - consisting of heavy polypeptide chains only, obtd. from Camelid serum, for use as antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The present sequence is given in a specification relating to isolated human proteins designated INTERCEPT 217, INVERCEPT 297, TANGO 292, TANGO 312, TANGO 313. These proteins are useful as modulating agents or as targeting agents for developing agents to regulate cellular processes e.g. growth, proliferation, survival, differentiation and activity of human tissues. Discasses which can be diagnosed, prevented and treated by administration of these polypeptides, their nucleic acids and modulators include cancers, inflammatory clasmosed, prevented and isorders e.g. arrhythmia, and skin disorders e.g. profits and accoding the isolated proteins can be used to express the proteins in a host cell in gene therapy applications.

Antisense molecules or ribozymes can be used to inhibit expression of the proteins in target cells. Fragments of the nucleic acid molecules encoding the isolated proteins as the protein and as encoding the isolated proteins as the protein and as hybridisation probes and as polymerase chain reaction (PCR) primers.
hypervariable polyprolline (HP) region modified to include a heterologous protein or peptide. Retroviral vectors made targetable by modification of the HP region enable the delivery of desired genes to a variety of cell types. Unlike prior art modifications in the receptor binding region, the particle does not disrupt envelope structure to impair folding, processing, and incorporation of the envelope protein. The present sequence represents an amphotropic hypervariable polyproline region truncated peptide from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated human proteins are used for diagnosis, treatment and prevention of cancers, inflammatory disorders, cardiac disorders e.g. arrhythmia, and skin disorders e.g. psoriasis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; INTERCEPT 217; INTERCEPT 297; TANGO 276; TANGO 292; TANGO 322;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     l;
                                                                                                                                                                                                                                                                                                                       The invention relates to novel synthetic genes for plant gums. A new approach is described to the production of hydroxyproline-rich alpyroproteins (RRPRS). repetitive proline-rich proteins (RRPRS) and arabino-galactan proteins (ARPS). Synthetic genes comprising a nucleic acid encoding the peptide (AAY01267) can be engineered for the production of repetitive glycopeptide modules in cells. The invention provided a new approach to the problem of producing plant gums that is not dependent on environmental factors and greatly simplifies the production of a variety of naturally occurring gums as well as designer

the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antinfiammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A Cu/Zn superoxide dismutase (SOD) polymer of SOD units of at least 2 SOD monomers covalently coupled, carboxy terminus to amino terminus, to each other by a polypeptide spacer of at least 3 amino acids is claimed. The polymers are of formula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

AAY64651 to AAZ65438 represent the EST-related proteins corresponding to AAZ42265 to AAZ43052. The 5' ESTs can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNA. The ESTs are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTs can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in gangeneting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be
19A = a \cdot 10-100 amino acid long segment of an immunoglobulin hinge region \kappa = 2-4
                                         AAN80435 was used to make pSODCFISODHAI encoding bacterial expression spacer-linked human SOD monomers. AAN80435 encodes human 1gAl hinge region beginning at AA residue 226 to avoid the Cys 225 residue with BamHI and NcoI sites at its ends. The SOD polymers have an extended circulatory life and retain the activity of SOD. The cloning and sequencing of human SOD (hSOD) cDNA and prodn. of hSOD in bacteria and yeast are described in EP-138111.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diagnostic, forensic, gene therapy, and chromosome mapping procedures

ij
used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins have therapeutic value, and the identification of new secreted proteins is valuable. AAZ42249 to AAZ42264 and AAY64644 to AAY64650 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This peptide comprises a Humicola insolens family 45 cellulase glycosylated linker used in a novel hybrid enzyme between the cellulose binding domain (CBD) of Mycellophthora thermophila cellulase and Humicola lanuqinosa lipase (Lipolase). DNA expressing the linker was obtained by PCR (see AAT90506-07). A DNA construct encoding CBD-glycosylated linker-Lipolase is given in AAT7070. A claimed process for desizing cellulose-containing fabric or textile involves treating the fabric or textile with a modified enzyme (enzyme hybrid) comprising a non-cellulolytic enzyme linked to a CBD. The process gives improved enzyme performance by modifying the enzyme so as to increase its affinity for cellulosic
                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Desizing cellulose-containing fabric or textile using an enzyme hybrid - which comprises a catalytically active amino acid sequence of a non-cellulolytic enzyme linked to an amino acid sequence

IgA is secreted by adults at high concentrations in their secretions. However newborn children have no mucosal IgA of their own. Human milk is very rich in IgA providing the infant with passive immunity by coating the mucous membranes with the antibody. Some bacteria secrete IgA proteases which inactivate the infants IgA, when it starts producing it, by cleavage at the hinge region, leading to infection of the infant. The most common allotype of IgA2 has the hinge region deleted and is therefore resistant to degradation by bacterial proteases. See also AAR37993.

This mucin peptide is used in a vaccine capable of producing an immune response which recognises a mucin. The mucin peptide is selected from MUCI peptide group. The vaccine comprises an amount of the mucin peptide conjugated to an immunogenic protein effective to stimulate or enhance immune response in the subject, together with an adjuvant and a vehicle. The immunogenic protein is a keyhole limpet haemocyanin (KLH) or its derivative. The vaccine can be used to induce an immune response in patients suffering from a cancer of the type where the cancer cells have mucin on their surface, e.g. breast cancer, prostate cancer, lung cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine effective against cancer of the breast, prostate, colon, lung or pancreas - comprising mucin peptide, especially MUC1, conjugated to immunogenic protein, especially keyhole limpet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 TSTSPIRSMAPGAVHLPQPVSTRSQHTQPTPEPSTAPSTSFLLPMGPSPPAEGST 55

response which recognises a mucin. The mucin peptide is selected from MUCl peptide group. The vaccine comprises an amount of the mucin peptide conjugated to an immunogenic protein effective to stimulate or enhance immune response in the subject, together with an adjuvant and a vehicle. A cysteine is added to the N-terminal of this peptide to facilitate the conjugation with protein carriers. The immunogenic protein is a keyhole limpet haemocyanin (KLH) or its derivative. The vaccine can be used to induce an immune response in patients suffering from a cancer of the type where the cancer cells have mucin on their surface, e.g. breast cancer, prostate cancer, lung cancer, colon cancer or pancreas cancer.
                                                                                                                                                                                                                                                                                                                                                                  This mucin peptide is used in a vaccine capable of producing an immune

"The complete mitochondrial DNA sequence of Atlantic cod (Gadus morhua): relevance to taxonomic studies among codfishes.";
Mol. Mar. Biol. Biotechnol. 5:203-214(1996).
-I- FUNCTION: THIS IS ONE OF THE CHAINS OF THE NONENZYMATIC COMPONENT (CF(0) SUBDINTY) OF THE MITOCHONDRIAL ATPASE COMPLEX.
-I- SUBCELLULAR LOCATION: MEMBRANE-BOUND.
-I- SIMILARITY: BELONGS TO THE ATPASE PROTEIN 8 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

"Phylogenetic studies of complete mitochondrial DNA molecules place cartilaginous fishes within the tree of bony fishes.";
U. Mol. Evol. 48:118-123(1999).
-: FUNCTION: THIS IS ONE OF THE CHAINS OF THE NONENZYMATIC COMPONENT (CF(0) SUBUNIT) OF THE MITOCHONDRIAL ATPASE COMPLEX.
-: SUBCELLULAR LOCATION: MEMBRANE-BOUND.
-: SIMILARITY: BELONGS TO THE ATPASE PROTEIN 8 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

"Complete mitochondrial DNA sequences for five birds and a turtle.";
Submitted (SEP-1998) to the EMBL/GenBank/DDBJ databases.
-: FUNCTION: THIS IS ONE OF THE CHAINS OF THE NONENZWATIC COMPONENT
(CF(0) SUBUNIT) OF THE MITOCHOMDRIAL ATPASE COMPLEX.
-: SUBCELLULAR LOCATION: MEMBRANE-BOUND.
-: SIMILARITY: BELONGS TO THE ATPASE PROTEIN 8 FAMILY.

decomposes the alpha-1,3 glucoside bond of mutan. The mutanase enzyme is used in the method of the invention for prevention and removal of plaque and bacteria on teeth.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New fungal (hemi)cellulose degrading enzymes – for prodn. of l1q. fuel gas and feed protein, have specified carbohydrate binding domain
                                                                                          This is the amino acid sequence of the mutanase enzyme PT box, which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Linking B region #8 derived from a (hemi)cellulose-degrading enzyme.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                     The polynucleotide sequences given in AAC99818 to AAC99977 encode the human secreted proteins given in AAB5607 to AAB56362. Human secreted proteins given in AAB5607 to AAB56362. Human secreted control in a activities based on the tissues and cells the genes are expressed in. Examples of activities include: immunosuppressive; antiarthritic; antirheumatic; antiproliferative; cytostatic; cardiant; ansotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; and opthalmalogical. The human secreted polynucleotides and proteins can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, and proteins or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The proteins can also be used to aid wound healing and epithelial cell proliferation, to painteen a pervent or prevent skin aging due to sunburn, to maintain organs before
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The proteins can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC99809 to AAC9817 and AAB56076 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                             Isolated nucleic acid molecule encoding a human secreted protein is used in preventing, treating or ameliorating a medical condition \,

    used for prevention and removal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mutanase enzyme; PT box; alpha-1,3 glucoside bond; mutan; plaque;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                               Sequence of a peptide which is part of the heavy (H) chain (CH3) of an
                                                                                                                                                                                                                                                                                                                                                          A novel immunoglobulin (Ig) is claimed which comprises two heavy (H) polypeptide chains sufficient for the formation of a complete antigen binding site or several such chains. The Ig is devoid of light (L) polypeptide chains. The Ig may be obtd. from prokaryotic cells, esp. E. coli, by: cloning a DNA or cDNA sequence coding for the WH domain of an Ig devoid of L chains obtainable from e.g. lymphocytes of Camelids; recovering the cloned fragment after amplification using a 5' primer contg. an Xho site and a 3' primer contg. the Spe site having the sequence in AAQ44383; cloning the recovered fragment is a vector; transforming host cells; and recovering the expression product of the VHH coding sequence. A nucleotide encoding the peptides in AAR49721-24 is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Immunoglobulin; Ig; heavy chain; constant region; variable region; antibody engineering; IgG2; IgG3.
                                                                                                                                                                                                                                                                                                            Immunoglobulins devoid of light chains - also processes for their preparation, and protein and nucleotide sequence encoding them.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This 2-chain Ig molecule lacks any light chains. The Ig has e.g. improved solubility and aggregate much less than heavy chains d. 4-chain IgS. The Igs can be used normally for e.g. diagnosis, therapy, in vaccines, for isolation and purification of antigens and in the production of anti-idiotype antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated immunoglobulin molecules devoid of light polypeptide chains - consisting of heavy polypeptide chains only, obtd. from Camelid serum, for use as antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present sequence is given in a specification relating to isolated human proteins designated INTERCEPT 217, INTERCEPT 297, TANGO 276, TANGO 292, TANGO 331 and TANGO 332. These proteins are useful as modulating agents or as targeting agents for developing agents to regulate cellular processes e.g. growth, proliferation, survival, differentiation and activity of human tissues. Diseases which can be diagnosed, prevented and treated by administration of these polypeptides, their nucleic acids and modulators include cancers, inflammatory discorders, cardiac disorders e.g. arrhythmia, and skin disorders e.g. provides, cardiac disorders e.g. arrhythmia, and skin disorders e.g. provides, cardiac caids encoding the isolated proteins can be used to express the proteins in a host cell in gene therapy applications.

Antisense molecules or ribozymes can be used to inhibit expression cof the proteins in target cells. Fragments of the nucleic acid molecules encoding the isolated proteins are used as hybridisation probes and as polymerase chain reaction (PCR) primers.
hypervariable polyproline (HP) region modified to include a heterologous protein or peptide. Retroviral vectors made targetable by modification of the HP region enable the delivery of desired genes to a variety of cell types. Unlike prior art modifications in the receptor binding region, the particle does not disrupt envelope structure to impair folding, processing, and incorporation of the envelope protein. The present sequence represents an amphotropic hypervariable polyproline region truncated peptide from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, INTERCEPT 217; INTERCEPT 297; TANGO 276; TANGO 292; TANGO 325;

                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ij
                                                                                                                                                                                                                                                                                                                                          The invention relates to novel synthetic genes for plant gums. A new approach is described to the production of hydroxyproline-rich glycoproteins (HRGPS). repetitive proline-rich proteins (RPRPS) and arabino-galactan proteins (AGPS). Synthetic genes comprising a nucleic acid encoding the peptide (AAY01267) can be engineered for the production of repetitive glycopeptide modules in cells. The invention provided a new approach to the problem of producing plant gums that is not dependent on environmental factors and greatly simplifies the production of a variety of naturally occurring gums as well as designer
                                                                                                                                                                                                                                - of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a retroviral vector particle (RVP1), having a modified retroviral envelope polypeptide which includes the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amphotropic hypervariable polyproline region truncated peptide N-14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     * retroviral vector particle - has envelope polypeptide modified the hypervariable polyproline region to enable cell targeting
                                                                                                                                                                                                                         Novel synthetic gene designed from repetitive peptide sequences

the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, proliferative disorders, neurodegenerative disorders, osteoarthritis, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A Cu/Zn superoxide dismutase (SOD) polymer of SOD units of at least 2 SOD monomers covalently coupled, carboxy terminus to amino terminus, to each other by a polypeptide spacer of at least 3 amino acids is claimed. The polymers are of formula (SOD monomer - IgA - SOD monomer - IgA - SO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          11;

                                                                                                                                                                                                                          셤
                                                                                                                                                                                                   ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST) sequences, corresponding to human secreted proteins. AAY64651 to AAZ638 the ESTS can be used for producing secreted human gene products. The 5' ESTS can be used for producing secreted human gene products. They can be used to identify and isolate 5' untranslated regions (UTRs) and upstream regulatory regions which control the location, development stage, rate, and quantity of protein synthesis, as well as stability of mRNN. The ESTS are also useful as probes for chromosome mapping, and to obtain full length cDNA clones. The ESTS can also be used in forensic procedures to identify individuals, or in diagnostic procedures to identify individuals, or in resulting from abnormal gene expression. The products may also be used in gene therapy protocols. The nucleic acids encoding signal peptides can be
IgA = a 10-100 amino acid long segment of an immunoglobulin hinge region x=2.4
                                 AAN80435 was used to make pSODCF1SODHA1 encoding bacterial expression spacer-linked human SOD monomers. AAN80435 encodes human IgAl hinge region beginning at AA residue 226 to avoid the Cys 225 residue with BamHI and NocI sites at its ends. The SOD polymers have an extended circulatory life and retain the activity of SOD. The cloning and sequencing of human SOD (hSOD) cDNA and prodn. of hSOD in bacteria and yeast are described in EP-138111.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel secreted protein 5' expressed sequence tag sequences used in diagnostic, forensic, gene therapy, and chromosome mapping procedures

                        insertion of a polypeptide into a membrane, or importing a polypeptide into a cell. The proteins encoded by the EST sequences may be useful in treating a variety of human conditions. Secreted proteins, have therapeutic value, and the identification of new secreted proteins is valuable. Az42249 to Az42264 and Az464644 to Az464650 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This peptide comprises a Humicola insolens family 45 cellulase glycosylated linker used in a novel hybrid enzyme between the cellulose binding domain (CBD) of Myceliophthora thermophila cellulase and Humicola lanuginosa lipase (Lipolase). DNA expressing the linker was obtained by PCR (see AA790506-07). A Construct encoding CBD-glycosylated linker-Lipolase is given in AA770700. A claimed process for desizing cellulose-containing fabric or textile involves treating the fabric or textile involves treating the fabric or textile with a modified enzyme (enzyme hybrid) comprising a non-cellulolytic enzyme linked to a CBD. The process gives improved enzyme performance by modifying the enzyme so as to increase its affinity for cellulosic
                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Desizing cellulose-containing fabric or textile using an enzyme hybrid - which comprises a catalytically active amino acid sequence of a non-cellulolytic enzyme linked to an amino acid sequence
used for directing extracellular secretion of a polypeptide or the

                                                                                                                                                                                                                                                                                                                                                                                                                               IgA is secreted by adults at high concentrations in their secretions. However newborn children have no mucosal IgA of their own. Human milk is very rich in IgA providing the infant with passive immunity by coating the mucous membranes with the antibody. Some bacteria secrete IgA proteases which inactivate the infants IgA, when it starts producing it, by cleavage at the hinge region, leading to infection of the infant. The most common allotype of IgA2 has the hinge region deleted and is therefore resistant to degradation by bacterial proteases. See also AAR37993.

This mucin peptide is used in a vaccine capable of producing an immune response which recognises a mucin. The mucin peptide is selected from MUCI peptide group. The vaccine comprises an amount of the mucin peptide conjugated to an immunogenic protein effective to stimulate or enhance immune response in the subject, together with an adjuvant and a vehicle. The immunogenic protein is a keyhole limpet haemocyanin (KLH) or its derivative. The vaccine can be used to induce an immune response in patients suffering from a cancer of the type where the cancer cells have mucin on their surface, e.g. breast cancer, prostate cancer, lung cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This mucin peptide is used in a vaccine capable of producing an immune response which recognises a mucin. The mucin peptide is selected from MUCI peptide group. The vaccine comprises an amount of the mucin peptide conjudated to an immunogenic protein effective to stimulate or enhance immune response in the subject, together with an adjuvant and a vehicle. A cystein is added to the N-terminal of this peptide to facilitate the conjugation with protein carriers. The immunogenic protein is a keyhole limpet haemocyanin (KLH) or its derivative. The vaccine can be used to induce an immune response in patients suffering from a cancer of the type where the cancer cells have mucin on their surface, e.g. breast cancer, prostate cancer, lung cancer, colon cancer or pancreas cancer.
                                                                                                                                                                                                                         Vaccine effective against cancer of the breast, prostate, colon, lung or pancreas - comprising mucin peptide, especially MUC1, conjugated to immunogenic protein, especially keyhole limpet
